Services exclusion

Time

3 months

Team

1 dev, 1 designer, 1 PM, 1 TW

Context

Introduction

In the HUB, a few services are no longer used or considered as temporary (e.g., seasonal illness clinics like flu treatment) and should not be included in the clinic’s statistics. However, these services can only be deleted in the EMR, which is a difficult process for medical staff. As a solution, a service exclusion feature was implemented in the HUB, allowing temporary services to remain unsynchronized without deletion. This exclusion is configurable during initial HUB setup and synchronization via a modal window.

Definitions

- HUB:** Synchronization platform for clinics and hospitals across Québec. Each healthcare facility securely uploads its information online via a EMR software.
- EMR:** Data management and storage software for hospitals and clinics (patients, staff, services, etc.).
- Sync:** Data synchronization between EMR, HUB, and Québec's registered healthcare worker API.
- Services:** Hospital department specializing in a specific pathology or medical discipline.
- Exclusion:** Temporary service exclusion to prevent synchronization.
- Deactivation:** Temporary service deactivation.

Goals

- Add steps to an already complex workflow while adhering to technical constraints
- Communicating service exclusions during system configuration to ensure transparency without overwhelming users.

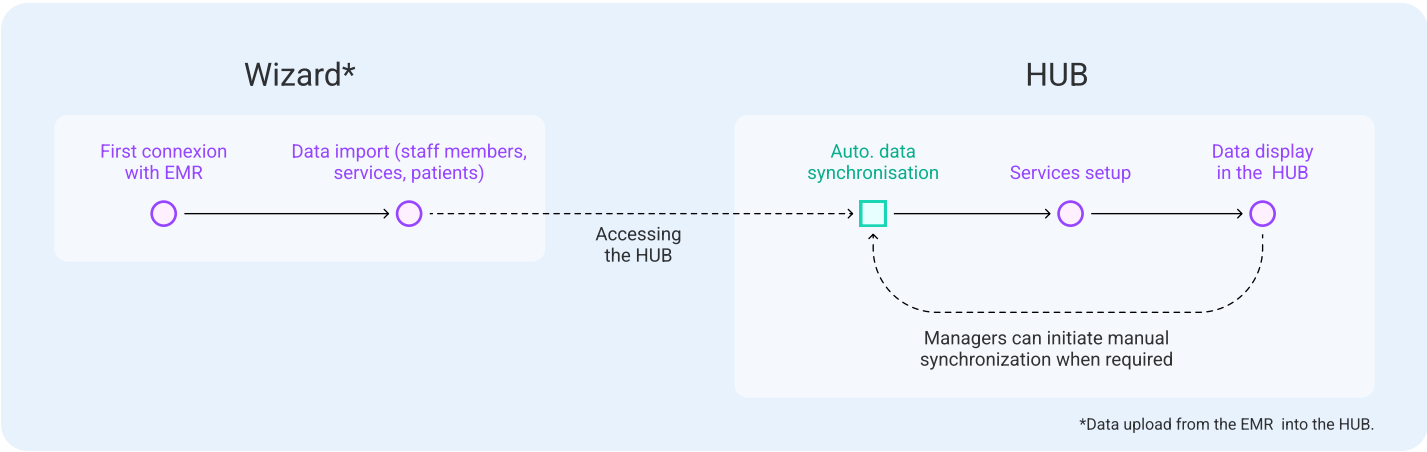

Constraints

- Service exclusion is only possible during synchronization.
- Existing overlapping steps (e.g., configuration, exclusion) which complexify the workflow.

Project workflow

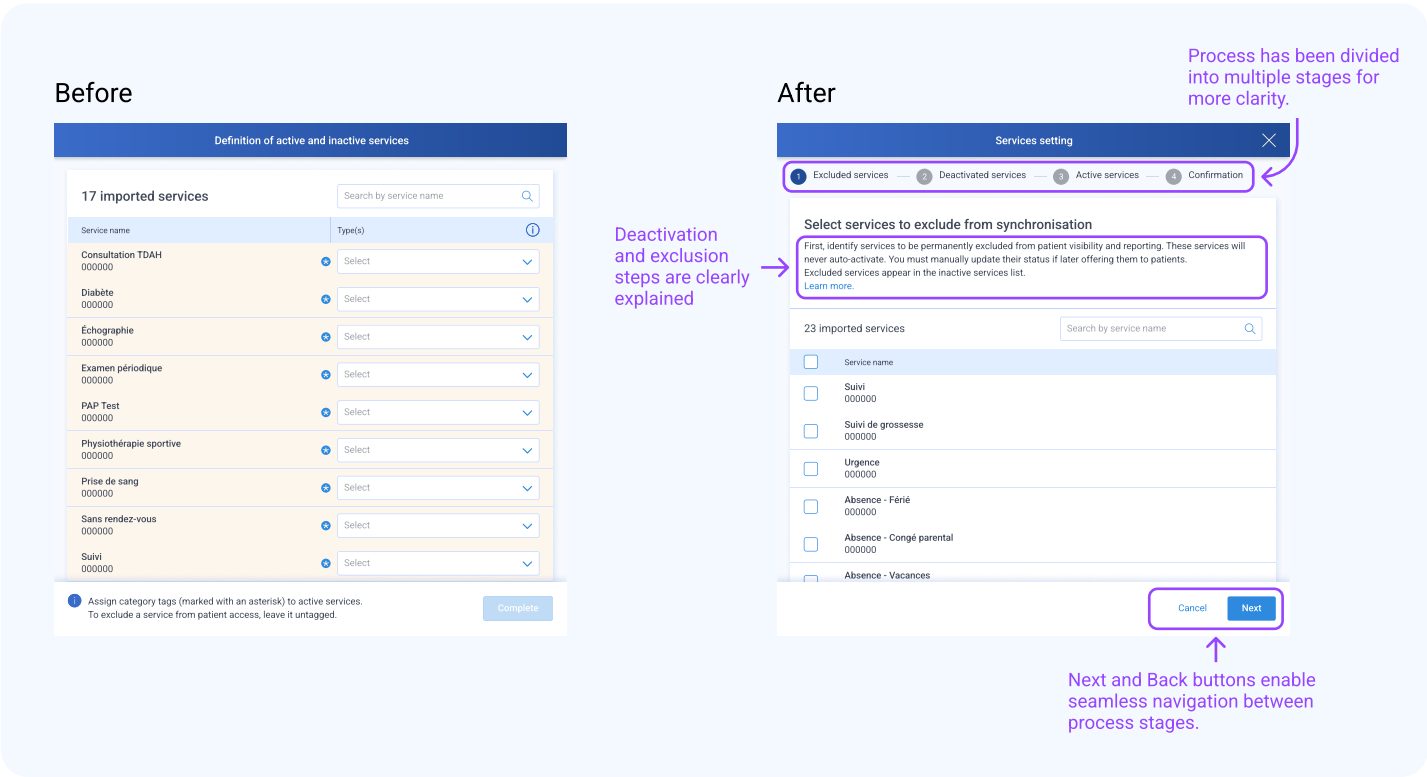

1 Kickoff & Scoping

During this phase, the Project Manager defines project requirements, goals, and technical constraints. The proposed solution needed to be integrated into the HUB’s synchronization modal. This stage also involved collaborative brainstorming of initial solution concepts in team.

2 Concept

The challenge was to help users understand they could disable/exclude unused services without overwhelming the interface, despite their familiarity only with activation. A step-by-step wizard and explanatory text were added, allowing users to select modified services. A final confirmation screen summarizing all steps was also implemented.

3 Handoff, release and refinements

After reviewing proposed solutions, the finalized design was handed off for development and deployment. I worked closely with developers to ensure the implemented solution aligned with design specifications and user needs.

Problème : The checkbox allowing to select services to exclude well used by managers, resulting in unintended bulk exclusions during synchronization...

4 Iteration

User testing with multiple clinics revealed usability issues in exclusion/deactivation workflows.

Managers frequently clicked the ‘Select All’ option, accidentally excluding all services from synchronization.

To resolve this, we redesigned the interface to visually emphasize exclusions, requiring users to manually deselect services they wished to exclude, and added a warning prompt to prevent errors.
